Conversion service

To facilitate North zone exchanges between H and L gas, NaTran offers you service for converting L gas into H gas.

– Converting L gas into H gas

NaTran offers a conversion service from L gas to H gas. The shipper makes available quantities of L gas to NaTran which supplies him simultaneously with same energy-content equivalent quantities of H gas within the terms of the conversion capacity subscribed by the shipper. The shipper can subscribe to conversion capacity from B gas into H gas on annual, monthly, daily or within-day basis on Prisma platform:

- Annual and monthly capacities are interruptible and marketed on the First Come First Served principle. For more information on the terms of subscription on Prisma, refer to information sheet in the [Transmission toolbox](#) to find out more about the commercialization of FCFS capacities on Prisma.
- Daily and within day capacities are interruptible. They are sold on Prisma during the auctions and tagged as “backhaul” for IT reasons.
